SOURCE: Zhurnal obshchey khimii, v. 36, no. 1, 1966, 161-162

TOPIC TAGS: phosphorus acid, phosphorus compound, exothermic reaction, IR spectrum, potassium compound

ABSTRACT: The addition of nucleophilic reagents: dimethyl- and diethyl-phosphorous acids, ethyl mercaptan, and diethylamine to butadiene was found to proceed in the presence of alcoholates of the alkali metals. Addition proceeds exothermally in the 1,2-position. 1-Dimethylphosphone-2,3-di(diethylphosphone)butene-3, 1,2,3-tri(diethylphosphone)butene-3, 1-mercaptoethyl-2,3-di(diethylphosphone)butene-3, and 1-diethylamino-2,3-di(diethylphosphone)butene-3 were synthesized; their structures were established by study of their infrared spectra and oxidation with potassium permanganate.

TITLE: Effect of temperature and humidity on the development of *Ornithodoros papillipes* Virula 1895 ticks

SOURCE: AN KazSSR. Izvestiya. Seriya biologicheskikh nauk, no. 5, 1965, 56-63

TOPIC TAGS: brucellosis, Q fever, equine encephalomyelitis, insect control, entomology

ABSTRACT: The object of the experiments described in this article was to determine the effect of temperature and humidity on the propagation and development of the *Ornithodoros papillipes* ticks. These ticks are widely distributed in Turkmenia, Tadzhikistan, Uzbekistan, Kirgizia, and South Kazakhstan. They are carriers of tick-borne recurrent typhus and contribute to the maintenance of foci of brucellosis, equine encephalomyelitis, and Q-fever. Combined test tubes prepared by placing a small test tube made of tubing into a larger test tube were used in the experiments. Different relative humidity conditions were created by the use of the following chemicals: potassium hydroxide in a dilution of 15:100; saturated solutions of sodium chloride, glucose, magnesium chloride, zinc chloride, and distilled water. Semigrown ticks gathered from the caves of the Chu-Iliysk mountains and fed on guinea pigs under laboratory conditions were used. One pair of

Card 1/2

UDC: 595.42

I 24736-66

ACC NR: AP6015519

ticks -- a male and a female -- were placed in each of the combined test tubes. Four combined test tubes were used for each of the created humidities. Different temperature conditions were maintained. Laboratory observations determined the effect of temperature and humidity on oviposition and development of the tick larvae and nymphs. The experiments established that *Ornithodoros papillipes* ticks survive a temperature of  $11.5^{\circ}\text{C}$ ; they do not, however, lay any eggs, and their larvae and nymphs do not develop; at a temperature of  $37^{\circ}\text{C}$  the ticks do not lay any eggs and perish; humidities in the range of 10 to 34 percent negatively affect oviposition, although nymphs can pass over into the next stage of development under these conditions; an optimal temperature of  $25-28^{\circ}\text{C}$  at humidity conditions of the air within the range of 55-90 percent may be regarded as being favorable to the development of the ticks; although oviposition is of a seasonal character, it can also occur during the winter period if laboratory conditions favorable for oviposition are created; air humidity can affect the rate of metamorphosis and the number of the nymph stages which precede the appearance of the semigrown ticks; high humidity at certain temperature conditions --  $21\pm 1^{\circ}\text{C}$  -- retard the appearance of the semigrown ticks, while low humidity hastens the development of the ticks by reducing the number of nymph stages which precede the appearance of the parasite. Title : Electrocardiograph Changes During Experimental Prolonged Fatty Embolism.

Orig Pub : Soobshch. AN GruzSSR, 1956, 17, No 10, 945-950

Abstract : Fatty embolism was caused in 12 rabbits by slowly introducing a small quantity of sterile rabbit fat in the vein. With the introduction of small doses each 24 hours, the lives of the animals were preserved up to 3-35 days. ECG were registered in standard readings. During the marked course of embolism, the changes went on during the 1-2nd introduction of fat, but with the introduction of very small doses - through 19-20 days. The sharpest changes were noted before the death of the animal. In the beginning, the pulse rate and systolic index increased,

Card 1/2

T-5

... - Blood Circulation.

USSR/Human and

Abs Jour : Ref Zhur - Biol., No 7, 1977 -

the T<sub>1</sub>-wave became high and mucronate, while the T<sub>3</sub>-wave -  
negative. The ST segment was displaced down in I degree  
and up to III degree readings. Proceeding from the  
Weissbein conception, the author proposes that the absence  
of changes in the II degree can be deffection reading used  
as a differential diagnostic between embolism of the pul-  
monary artery and infarct of the miocardia. The ECG cha-  
racteristics are registered not only for fatty embolism,  
but also for the hypoxia of the miocardia connected with  
difficulty of gaseous exchange in the lungs and with local  
disorders of circulation in the cardiac muscle due to obs-  
truction of vessels. With such a form of embolism, the  
pulmo-coronary reflex has second-degree value.

TITLE: The construction of relay characteristics by means of the sums of typical series

SOURCE: Kazan. Aviatсионny\*y institut. Trudy\*, no. 75, 1963 Aviatсионny\*ye pribory\* i avtomaty\* (Aeronautical instruments and automatic equipment), 70-79

TOPIC TAGS: aircraft automation, relay system, automatic control system

ABSTRACT: In this article, which is almost wholly mathematical in character, an investigation of the periodic conditions of automatic control systems is made by means of the so-called relay characteristics of Ya. Z. Tsytin. The latter are functions of two parameters: frequency  $\omega$  and the time of the closed state of the contacts  $\tau$ . The author essentially presents a further refinement of Tsytin's method (Ya. Z. Tsytin, Teoriya releyny\*kh sistem avtomaticheskogo regulirovaniya, 1955), making it possible to simplify the construction of the relay characteristics. Fundamentally, the refinement consists of representing  $I(\omega)$  and  $I_{\tau}(\omega)$  by means of a certain number of typical series so that, when determining the relay characteristics, ready sums can be used and the construction reduced to the addition of known sums. It is shown that the introduction of the typical series concept facilitates considerably the determination of relay characteristics.

Card 1/2

L 14533-65

ACCESSION NR: AT4047565

The author claims that the mathematical method described in this paper can also be used in the study of the spatial periodic movement of two-channel automatic control systems which contain relay elements in both channels. Orig. art. has: 4 formulae plus 18 in the appendix.

TITLE: <sup>16</sup> Stability of systems with random parameters

SOURCE: AN KazSSR. Sektor matematiki i mekhaniki. Issledovaniya po differentsial'nym uravneniyam i ikh primeneniyu (Research on differential equations and their application). Alma-Ata, Izd-vo Nauka, 1965, 184-189

TOPIC TAGS: probability, difference equation, parameter, Markov process, asymptotic property, vector, coordinate system, function, motion equation, bounded function

ABSTRACT: Sufficient conditions for stability with respect to probability and asymptotic stability on the whole of a system of stochastic difference equations are established. The system

$$x_{k+1} - x_k = f(x_k, \eta_{k+1}) \quad (k = 1, 2, \dots)$$

is subjected to an action in the form of a Markov chain with an even number of states. Four definitions of stability of the solution  $x = 0$  of the system are considered. Theorems analogous to the theorems of the second method of Lyapunov are formulated. If for the given system there exists a positive definite function  $v(x, \eta)$  that

Cord 1/2

L 26011-66

ACC NR: AT6013428

permits an infinitely small upper and an infinitely large lower bound in the domain  $H = \infty$ , while the first difference is a negative definite function in the domain  $H = \infty$ , then the solution  $x = 0$  will be strongly stable on the large. Orig. art. has: 38 formulas.

TITLE: Self-oscillations in two-channel contactor systems of automatic control

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 11, 1961, 43, abstract 11 V348 (Tp. Kazansk. aviats. in-ta, 1960, no 58, 23-32)

TEXT: The searched-for periodic motions of the contactor elements in a system of automatic control with 2 identical channels and anti-symmetric cross couplings were expanded in Fourier series. The searched-for periodic parameters are: Frequency of self-oscillation  $\omega = \frac{2\pi}{T}$ , and the time shift  $\tau$  between the rectangular successions at the output of the contactor. For the purpose of convenience in solving the equations and inequalities expressing the conditions of existence of self-oscillations  $x_1(0) = 0; x_2(\tau) = 0;$

TITLE: A study of the stability of two-channel systems with antisymmetrical cross coupling

CITED SOURCE: Tr. Kazansk. aviats. in-ta, vy\*tp. 75, 1963, 85-90

TOPIC TAGS: two-channel system, antisymmetrical cross coupling, Nyquist-Mikhaylov criterion

TRANSLATION: On the basis of a brief analysis, the author concludes that the best analytic criterion for the stability of two-channel systems with antisymmetrical cross coupling (TCACC) is the Nyquist-Mikhaylov criterion. The experimental determination of the frequency characteristics of TCACC may be carried out by separately taking the basic  $W_0(i\omega)$  and cross coupling  $W_{\Sigma}(i\omega)$  characteristics. This procedure makes it possible to avoid cumbersome computations involved in the construction of linear amplitude characteristics (LAC) and linear phase characteristics (LPC) by the usual methods. With reference to the problem to be

Card 1/2

ACCESSION NR: AR4014942

formulated, the Nyquist-Mikhaylov criterion is stated as follows: a closed TCACC is stable if and only if the sum of the number of integral  $(\neq 2\pi)$  positive revolutions of the characteristic  $W_0(i\omega)$  about the point  $(-1,0)$  and the characteristic  $i \frac{W_n(i\omega)}{1 \neq W_0(i\omega)}$  about the point  $(-1,0)$  as  $\omega$  varies from  $-\infty$  to  $\neq \infty$  was equal to the m-number of right-hand roots  $d(p)$ . An example is given. Four illustrations. Bibliography with seven titles. V.Ya.

TITLE: Stability of stochastic difference systems with continuous perturbations

SOURCE: Differentsial'nyye uravneniya, v. 2, no. 9, 1966, 1161-1169

TOPIC TAGS: approximation, perturbation, Markov process, stochastic process

SUB CODE: 12

ABSTRACT: The theory on the stability of differential equations in the first approximation and with continuous perturbations is extended to stochastic difference systems subjected to random Markov effects. The investigation is based on a modification of Lyapunov's second method.

Three systems are investigated:

1) A system described by the stochastic vector difference equation

$$x_{k+1} - x_k = [A(\eta_{k+1})x_k + Q(x_k, \eta_{k+1})]h, \quad (1)$$

where  $x$  is an  $n$ -dimensional vector of the phase coordinates of the system  $\{x^{(1)}, \dots, x^{(n)}\}$ ;  $h$  is the period of the equation;  $k$  is the number of the period;  $\eta \in Y \{\eta^{(1)}, \dots, \eta^{(r)}\}$  is the Markov probability chain with an even number of states  $\eta^{(j)}$ ,

Card 1/2

UDC: 517.934

ACC NR: AP7008907

2) A stochastic system of difference equations of perturbed motion of the form

$$x_{k+1} - x_k = [A(\eta_{k+1})x_k + Q(x_k, (k+1)h, \eta_{k+1})]h, \quad (2.1)$$

where  $A(\eta)$  is a matrix, and function  $Q^{(1)}$  depends explicitly on  $k$ .

3) A system described by a stochastic vector difference equation of the form

$$x_{k+1} - x_k = [A(\eta_{k+1})x_k + bR_{k+1}]h, \quad (3.1)$$

where  $b$  is an  $n$ -dimensional constant vector  $\{b^{(1)}, \dots, b^{(n)}\}$ ; and  $R = \{R^{(1)}, \dots, R^{(n)}\}$  is a random vector function describing the continuous perturbation.

Theorems are stated and proved for each system.

The author thanks N.N. Krasovskiy for valuable advice and instructions.

AUTHORS: Abdrakhmanov, M.I., and Akhmetov, A.G.

TITLE: A two-position dry-air thermostat temperature controller

PERIODICAL: Priborostroyeniye, no. 1, 1962, 26

TEXT: The authors describe temperature controlling circuit using a semi-conductor temperature transducer; the circuit was developed at the SKTB MFP. The sensing element, transforming the temperature into electrical signals is the thermal resistor MMT-4, making one of the arms of a balanced bridge, the two other arms of which are composed of wire-wound resistors  $R_1$  and  $R_2$ , the fourth arm having wire-wound resistors  $R_4$  (coarse) and  $R_3$  (fine adjustment). The bridge supply is 50 c/s mains. The main advantage of the bridge is that it is practically insensitive to supply voltage changes. The output of the bridge, being inadequate to operate the switching relay of the heating system, is amplified in a 4-stage amplifier using  
Card 1/2

A two-position dry-air thermostat ...

D201/D302

pencil-type tubes type 6H2П (6N2P) and 6H1П (6N1P). The HT amplifier power supply has a bridge-type rectifier with type ДГ-Ц24 (DG-Ts24) diodes. The first and third stages of amplification have anode decoupling. The last stage operates as a coincidence circuit, i.e. it amplifies the signal only when both anode and grid are positive. The anode load of the fourth tube is the relay РДУГ (RDCh G). The arrangement which switches the supply to the heating arrangement and the tubes is the relay PKH(RKN). The power supply unit consists of a transformer, rectifier and filter. The transformer has the primary tapped for 127 and 220 V and secondary for 200; 110; 150; 6.3; 24 and 6 V. The 200 and 150 windings are screened from each other. The laboratory tests of the dry air thermostat Ц-450 (Ts-450) with the new temperature control have shown that while with the described circuit the basic thermostat parameters become simpler, the accuracy increases from  $\pm 0.5$  to  $\pm 0.25^{\circ}\text{C}$  and the sensitivity of the transducer increases to  $\pm 0.1^{\circ}\text{C}$ . The life-time of the controller also increases. The control temperature range is 20 - 60°C. There is 1 figure. [Abstractor's note: Essentially a complete translation].

TITLE: Hydrodynamic structure of a vortex ring

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 4, 1966, 120-123

TOPIC TAGS: vortex, shock generated vorticity, velocity measuring instrument, hydrodynamics, air flow

ABSTRACT: The authors investigated experimentally the structure of an air vortex ring by methods of thermoanemometry and high-speed motion picture photography. The air flow was produced by a piston moving in a cylindrical tube and striking a partition, and the vortex formation was produced by the nozzle placed on the free end of the cylinder. The shape of the nozzle was determined experimentally. The velocity field of the vortex rings was measured with two thermoanemometers located at fixed distances from the end of the tube (Fig. 1). The measurements yielded the velocity field, the streamline pattern, and the distribution of the velocity curl. The results confirmed the classical streamline pattern. It is shown that the velocity curl is localized almost entirely inside a central toroidal region called the core of the vortex ring, with the axes of the torus coinciding with the circular axis of the vortex. The velocity curl drops off rapidly from the center of the core with increasing distance from the center of the core. An analysis of the experimental results leads to the

Card 1/2

TITLE: Some Questions Relating to the Automatization of Production Processes in Refining Factories of the Nonferrous Metallurgical Works of Kazakhstan (Nekotoryye voprosy avtomatizatsii proizvodstvennykh protsessov na obogatitel'nykh fabrikakh tsvetnoy metallurgii Kazakhstana)

PERIODICAL: Priborostroyeniye, 1958, Nr 11, pp 13-15 (USSR)

ABSTRACT: The large flotation-enrichment factories are characteristic of the lead-zinc, copper, copper-nickel, and copper-molybdenum metallurgical plants of Kazakhstan. At present, the technological processes in connection with the production of the concentrate are far from being automatized. Thus, from 16 to 31 % of the entire personnel are at present required for the work of taking samples. This is all the more astonishing as the factories of **Berezovskiy, Balkhash, and Mirgalinsay** have well-functioning automatic sample-collectors in operation. No such device was set up in the enrichment-factory of Achisay in 1957. "Mekhanobr" developed an electric metal-detector in the course of recent years.

Some Questions Relating to the Automatization of Production Processes in Refining Factories of the Nonferrous Metallurgical Works of Kazakhstan

As soon as a metal object is detected on the conveyer band, a warning signal is sounded. The object is removed by hand and the blocking of the band is lifted. Only two devices of this type are in operation, viz. at the enrichment factory of Zyryanovsk. In the Balkhash works the entire transport system of the crusher department is automatically switched on- and off. The relative production of this station was increased by 100 % during the last year. Conveying of material to the rock-crushing mills has been automatized only at the Tyrny-Auz works. The result was a 45 % saving of personnel. The automatic control of pulp density proved to be especially economical. A sum of 3 million Rubles was saved per annum at Balkhash. At other factories automatization has as yet not been introduced. At Balkhash work is at present being carried out for the purpose of automatizing the working of acidified copper ore (Professor Mostovich). The concentrate now contains 30-35 % copper as against 15-17 %, which was its former content. "Gintsvetmet" worked out a project for the complete automatization of a copper factory. The costs amount to 9,9
